

Transactions & Concurrency Control 2

R&G 16/17

There are three side effects of acid. Enhanced long term memory, decreased short term memory, and I forget the third.

- Timothy Leary

TWO PHASE LOCKING

Two Phase Locking (2PL)

- **The most common scheme for enforcing conflict serializability**
- **A bit “pessimistic”**
 - Sets locks for fear of conflict... Some cost here.
 - Alternative schemes use multiple versions of data and “optimistically” let transactions move forward
 - Abort when conflicts are detected.
 - Some names to know/look up:
 - Optimistic Concurrency Control
 - Timestamp-Ordered Multiversion Concurrency Control
 - We will not study these schemes in this lecture

Two Phase Locking (2PL), Part 2

- Rules:
 - Xact must obtain a S (shared) lock before reading, and an X (exclusive) lock before writing.
 - **Xact cannot get new locks after releasing any locks**

Lock
Compatibility
Matrix

	S	X
S	✓	—
X	—	—

Two Phase Locking (2PL), Part 3

- **2PL guarantees conflict serializability (why?)**
- But, does not prevent **cascading aborts**

Why 2PL guarantees conflict serializability

- When a committing transaction has reached the end of its acquisition phase...
 - Call this the “lock point”
 - At this point, it has *everything it needs* locked...
 - ... and any conflicting transactions either:
 - started release phase before this point
 - are blocked waiting for this transaction
- Visibility of actions of two conflicting transactions are ordered by their lock points
- The order of lock points gives us an equivalent serial schedule!

Strict Two Phase Locking (2PL)

- **Problem: Cascading Aborts**
- Example: rollback of T1 requires rollback of T2!

T1:	R(A), W(A)		Abort
T2:		R(A), W(A)	

Strict Two Phase Locking

- Same as 2PL, except all locks released together when transaction completes
 - (i.e.) either
 - Transaction has committed (all writes durable), OR
 - Transaction has aborted (all writes have been undone)

Next ...

- A few examples

Non-2PL, A = 1000, B = 2000, Output = ?

T1	T2
Lock_X(A)	
Read(A)	
	Lock_S(A)
A: = A-50	
Write(A)	
Unlock(A)	
	Read(A)
	Unlock(A)
	Lock_S(B)
Lock_X(B)	
	Read(B)
	Unlock(B)
	PRINT(A), PRINT(B), PRINT(A+B)
Read(B)	
B := B +50	Output: 950, 2000, 2950
Write(B)	
Unlock(B)	

Non-2PL, A = 1000, B = 2000, Output = ? cont

T1	T2
Lock_X(A)	
Read(A): (A=1000)	
	Lock_S(A)
A: = A-50 (A=950)	
Write(A) A=950	
Unlock(A)	
	Read(A) (A = 950)
	Unlock(A)
	Lock_S(B)
Lock_X(B)	
	Read(B) (B=2000)
	Unlock(B)
	PRINT(A), PRINT(B), PRINT(A+B)
Read(B) (B=2000)	
B := B + 50 (B=2050)	
Write(B) B=2050	
Unlock(B)	

Output: 950, 2000, 2950

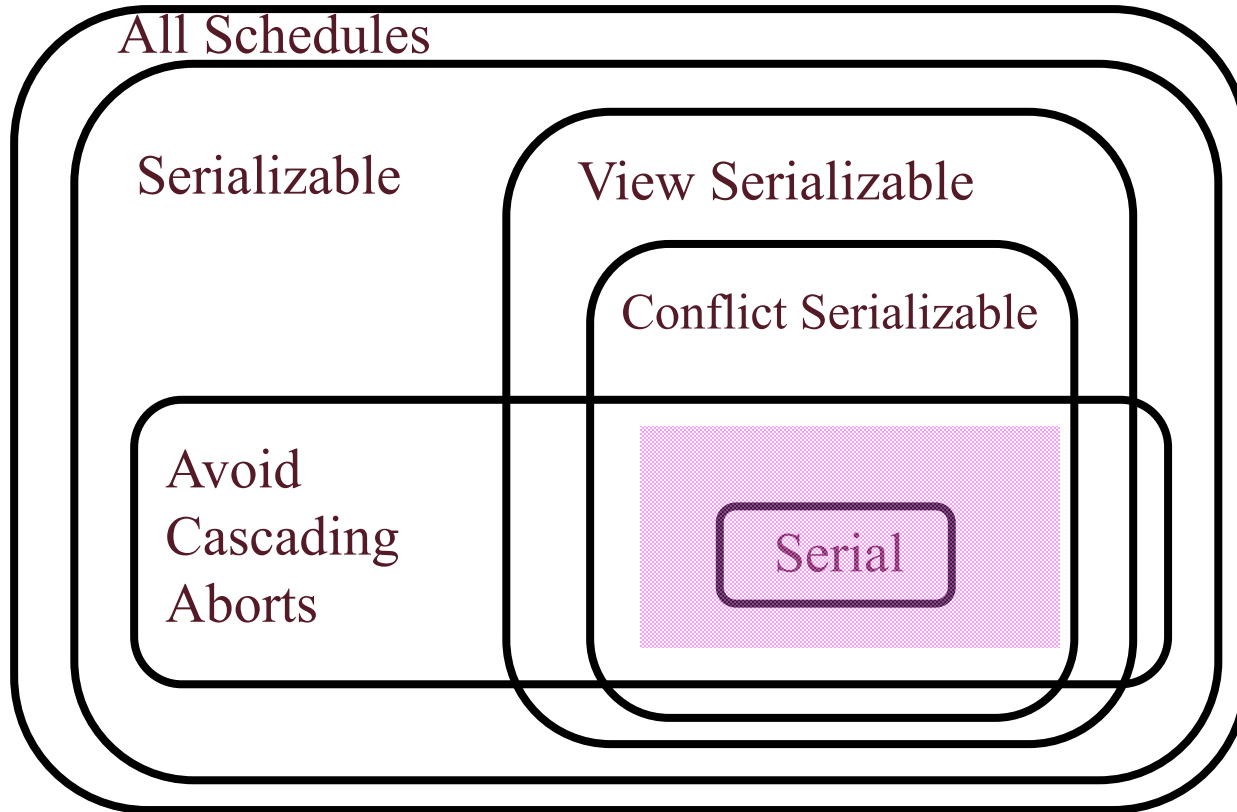

2PL, A = 1000, B = 2000, Output = ?

T1	T2
Lock_X(A)	
Read(A)	
A: = A-50	
Write(A)	
Lock_X(B)	
Unlock(A)	
	Lock_S(A)
	Read(A)
Read(B)	
B := B + 50	
Write(B)	
Unlock(B)	
	Lock_S(B)
	Unlock(A)
	Read(B)
Output: 950, 2050, 3000	Unlock(B)
	PRINT(A), PRINT(B), PRINT(A+B)

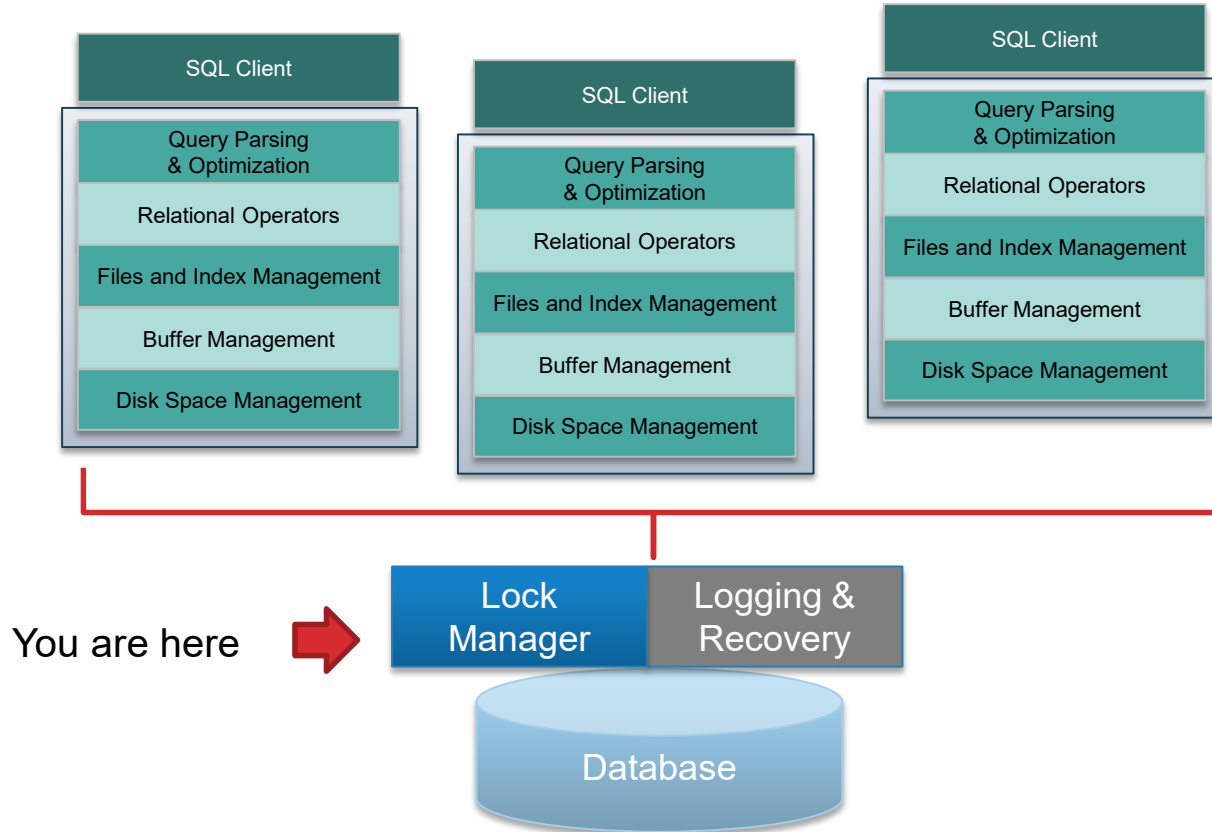

Strict 2PL, A = 1000, B = 2000, Output = ?

T1	T2
Lock_X(A)	
Read(A)	
	Lock_S(A)
A: = A-50	
Write(A)	
Lock_X(B)	
Read(B)	
B := B +50	
Write(B)	
Unlock(A)	
Unlock(B)	
	Read(A)
	Lock_S(B)
	Read(B)
	PRINT(A), PRINT(B), PRINT(A+B)
Output: 950, 2050, 3000	Unlock(A)
	Unlock(B)

Which schedules does Strict 2PL allow?

Architecture

How Do We Lock Data?

- Not by any crypto or hardware enforcement
 - There are no adversaries here ... this is all within the DBMS
- We lock by simple convention:
 - Within DBMS internals, we observe a lock *protocol*
 - If your transaction *holds* a lock, and my transaction *requests* a conflicting lock, then I am queued up waiting for that lock.

Lock Management

- Lock and unlock requests handled by Lock Manager
- LM maintains a hashtable, keyed on names of objects being locked.
- LM keeps an entry for each currently held lock
- Entry contains
 - Granted set: Set of xacts currently granted access to the lock
 - Lock mode: Type of lock held (shared or exclusive)
 - Wait Queue: Queue of lock requests

	Granted Set	Mode	Wait Queue
A	{T1, T2}	S	T3(X) \leftarrow T4(X)
B	{T6}	X	T5(X) \leftarrow T7(S)

Lock Management (continued)

- **When lock request arrives:**
 - Does any xact in Granted Set or Wait Queue want a conflicting lock?
 - If no, put the requester into “granted set” and let them proceed
 - If yes, put requester into wait queue (typically FIFO)
- **Lock upgrade:**
 - Xact with shared lock can request to upgrade to exclusive

	Granted Set	Mode	Wait Queue
A	{T1, T2}	S	T2(X) ← T3(X) ← T4(X)
B	{T6}	X	T5(X) ← T7(S)

Example

Lock_X(A)	
	Lock_S(B)
	Read(B)
	Lock_S(A)
Read(A)	
A: = A-50	
Write(A)	
Lock_X(B)	

Final lock table state:

A:

X lock held by T1
wait queue = [T2 wants S]

B:

S lock held by T2
wait queue = [T1 wants X]

Uh-oh, T1 and T2 are waiting for each other!

DEADLOCK

Deadlocks, cont

- **Deadlock: Cycle of Xacts waiting for locks to be released by each other.**
- **Three ways of dealing with deadlocks:**
 - Prevention
 - Avoidance
 - Detection and Resolution
- **Many systems just punt and use timeouts**
 - What are the dangers with this approach?

Deadlock Scenarios

- They can just happen (unavoidable)

	Granted Set	Mode	Wait Queue
A	{T1}	S	T2(X)
B	{T2}	X	T1(S)

- Bad implementation of Lock Upgrade (avoidable! prioritize upgrades)

	Granted Set	Mode	Wait Queue
A	{T1, T2}	S	T3(X) ← T4(X) ← T2(X)

- Multiple Lock Upgrades (unavoidable)

	Granted Set	Mode	Wait Queue
A	{T1, T2}	S	T2(X) ← T1(X) ← T3(X) ← T4(X)

Deadlock Scenarios

- They can just happen (unavoidable)

	Granted Set	Mode	Wait Queue
A	{T1}	S	T2(X)
B	{T2}	X	T1(S)

- Bad implementation of Lock Upgrade (avoidable! prioritize upgrades)

	Granted Set	Mode	Wait Queue
A	{T1, T2}	S	T2(X) ← T3(X) ← T4(X)

- Multiple Lock Upgrades (unavoidable)

	Granted Set	Mode	Wait Queue
A	{T1, T2}	S	T2(X) ← T1(X) ← T3(X) ← T4(X)

Deadlock Prevention

- **Common technique in operating systems**
- **Standard approach: resource ordering**
 - Screen < Network Card < Printer
- **Why is this problematic for Xacts in a DBMS?**
 - What order would you impose?

Deadlock Avoidance

- **Assign priorities based on age: (now – start_time).**
- Say T_i wants a lock that T_j holds. Two possible policies:
 - **Wait-Die:** If T_i has higher priority, T_i waits for T_j ; else T_i aborts
 - **Wound-Wait:** If T_i has higher priority, T_j aborts; else T_i waits
- Read each of these like a ternary operator (C/C++/java/javascript)

Deadlock Avoidance: Analysis

- Q: Why do these schemes guarantee no deadlocks?
 - Q: What do the previous images have in common?
- Important Detail: If a transaction re-starts, make sure it gets its original timestamp. Why?
- Note: other priority schemes make sense
 - E.g. measures of resource consumption, like #locks acquired

Deadlock Detection

- Create and maintain a “**waits-for**” graph
- Periodically check for cycles in a graph

Deadlock Detection, Part 2

Example:

T1:

T2:

T3:

T4:

Deadlock Detection, Part 3

Example:

T1: S(A)

T2:

T3:

T4:

Deadlock Detection, Part 4

Example:

T1: S(A) S(D)

T2:

T3:

T4:

Deadlock Detection, Part 5

Example:

T1: S(A) S(D)

T2: X(B)

T3:

T4:

Deadlock Detection, Part 6

Example:

T1: S(A) S(D) S(B)

T2: X(B)

T3:

T4:

Deadlock Detection, Part 7

Example:

T1: S(A) S(D) S(B)
T2: X(B)
T3: S(D)
T4:

Deadlock Detection, Part 8

Example:

T1: S(A) S(D) S(B)
T2: X(B)
T3: S(D), S(C)
T4:

Deadlock Detection, Part 9

Example:

T1: S(A) S(D) S(B)
T2: X(B) X(C)
T3: S(D) S(C)
T4:

Deadlock Detection, Part 10

Example:

T1: S(A) S(D) S(B)
T2: X(B) X(C)
T3: S(D) S(C)
T4: X(B)

Deadlock Detection, Part 11

Example:

T1: S(A) S(D)

S(B)

T2: X(B)

X(C)

T3: S(D) S(C) X(A)

T4: X(B)

Deadlock!

- **T1, T2, T3 are deadlocked**
 - Doing no good, and holding locks
- **T4 still cruising**
- **In the background, run a deadlock detection algorithm**
 - Periodically extract the waits-for graph
 - Find cycles
 - “Shoot” a transaction on the cycle
- **Empirical fact**
 - Most deadlock cycles are small (2-3 transactions)

LOCK GRANULARITY

Lock Granularity, cont

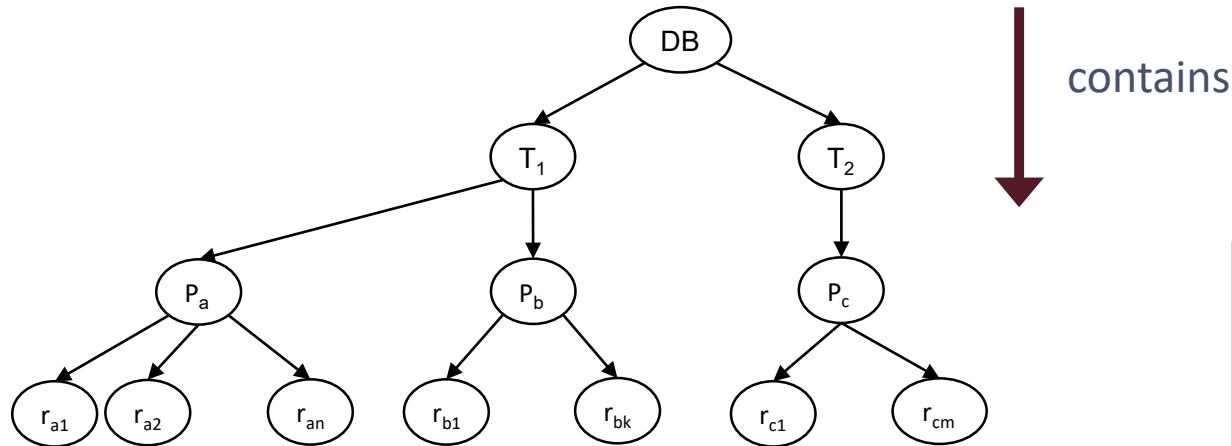

- Hard to decide what granularity to lock
 - Tuples vs Pages vs Tables?
- What is the tradeoff?
 - Fine-grained availability of resources would be nice (e.g. lock per tuple)
 - Small # of locks to manage would also be nice (e.g. lock per table)
 - Can't have both!
 - Or can we???

Multiple Locking Granularity

- **Shouldn't have to make same decision for all transactions!**
- Allow data items to be of various sizes
- Define a hierarchy of data granularities, small nested within large
 - Can be represented graphically as a tree.

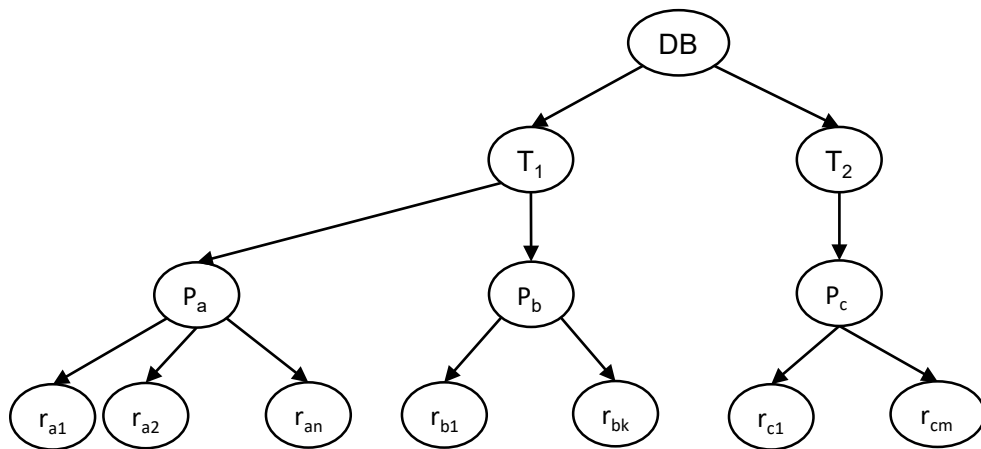

Example of Granularity Hierarchy (RDBMS)

- Data “containers” can be viewed as nested.
- The levels, starting from the coarsest (top) level are
 - Database, Tables, Pages, Records
- When a transaction locks a node in the tree **explicitly**, it **implicitly** locks all the node’s descendants in the same mode.

Multiple Locking Granularity

- Granularity of locking (level in tree where locking is done):
 - Fine granularity** (lower in tree): High concurrency, lots of locks (high overhead)
 - Coarse granularity** (higher in tree): Few locks (low overhead), lost concurrency
 - Lost potential concurrency if you don't need everything inside the coarse grain

Real-World Locking Granularities

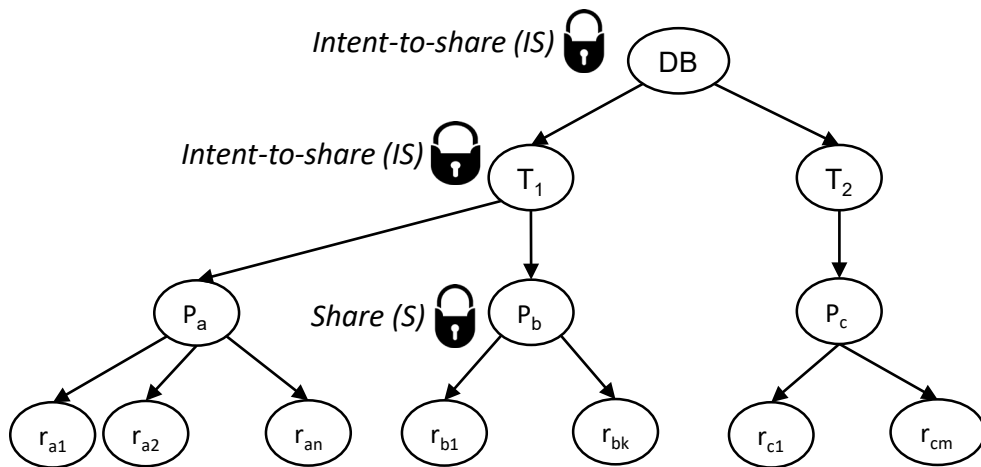

Resource	Description
RID	A row identifier used to lock a single row within a heap.
KEY	A row lock within an index used to protect key ranges in serializable transactions.
PAGE	An 8-kilobyte (KB) page in a database, such as data or index pages.
EXTENT	A contiguous group of eight pages, such as data or index pages.
HoBT	A heap or B-tree. A lock protecting a B-tree (index) or the heap data pages in a table that does not have a clustered index.
TABLE	The entire table, including all data and indexes.
FILE	A database file.
APPLICATION	An application-specified resource.
METADATA	Metadata locks.
ALLOCATION_UNIT	An allocation unit.
DATABASE	The entire database.

From MS SQL Server

[https://technet.microsoft.com/en-us/library/jj856598\(v=sql.110\).aspx](https://technet.microsoft.com/en-us/library/jj856598(v=sql.110).aspx)

Solution: New Lock Modes, Protocol

- Allow xacts to lock at each level, but with a special protocol using new “intent” locks:
- Before getting S or X lock, Xact must have proper intent locks on all its ancestors in the granularity hierarchy.

New Lock Modes – Intention Lock Modes

- 3 additional lock modes:
 - **IS:** *Intent to get S lock(s) at finer granularity.*
 - **IX:** *Intent to get X lock(s) at finer granularity.*
 - **SIX:** *Like S & IX at the same time. Why useful?*
- Intention locks allow a higher level node to be locked in S or X mode without having to check all descendent nodes

Multiple Granularity Locking Protocol

- Each Xact starts from the root of the hierarchy.
- To get S or IS lock on a node, must hold IS or IX on parent node.
 - What if Xact holds S on parent? SIX on parent?
- To get X or IX or SIX on a node, must hold IX or SIX on parent node.
- Must release locks in bottom-up order.
- 2-phase and lock compatibility matrix rules enforced as well
- Protocol is correct in that it is *equivalent to directly setting locks at leaf levels of the hierarchy*.

Lock Compatibility Matrix

- IS – Intent to get S lock(s) at finer granularity.
- IX – Intent to get X lock(s) at finer granularity.
- SIX mode: Like S & IX at the same time.

	IS	IX	S	SIX	X
IS					
IX					
S			true		false
SIX					
X			false		false

Database
|
Tables
|
Pages
|
Tuples

Handy simple case to remember:
Could 2 intent locks be compatible?

Page P	Tuple t1	S	IS
	Tuple t2	X	IX

Lock Compatibility Matrix, Cont

- IS – Intent to get S lock(s) at finer granularity.
- IX – Intent to get X lock(s) at finer granularity.
- SIX mode: Like S & IX at the same time.

	IS	IX	S	SIX	X
IS	true	true	true	true	false
IX	true	true	false	false	false
S	true	false	true	false	false
SIX	true	false	false	false	false
X	false	false	false	false	false

From MS SQL Server

[https://technet.microsoft.com/en-us/library/jj856598\(v=sql.110\).aspx](https://technet.microsoft.com/en-us/library/jj856598(v=sql.110).aspx)

For Your Information: Indexes

- **2PL on B+ tree pages is a rotten idea.**
 - Think about the first thing you would lock, and how that affects other xacts!
- **Instead, do short locks (latches) in a clever way**
 - Idea: Upper levels of B+ tree just need to direct traffic correctly. Don't need serializability or 2PL!
 - Different tricks to exploit this
 - The *B-link* tree is elegant
 - The *Bw-tree* is a recent variant for main memory DBs
- **Note: this is pretty complicated!**

For Your Information: Phantoms

- **Suppose you query for sailors with rating between 10 and 20, using an Alternative 2 B+ tree**
 - You set tuple-level locks in the Heap File
- **I insert “Dread Pirate Roberts”, with rating 12**
- **You do your query again via the index**
 - Yikes! A phantom
- **Problem: Serializability assumed a static DB**
- **What we want: lock the logical range 10-20**
 - Hard to imagine that lock table! Doesn't work well.
- **What is done: set locks in indexes cleverly**
 - So-called “next key locking”

Summary, cont.

- **Correctness criterion for isolation is “serializability”.**
 - In practice, we use “conflict serializability” which is conservative but easy to enforce
- **Two Phase Locking and Strict 2PL: Locks implement the notions of conflict directly**
 - The lock manager keeps track of the locks issued.
 - **Deadlocks** may arise; can either be prevented or detected.
- **Multi-Granularity Locking:**
 - Allows flexible tradeoff between lock “scope” in DB, and # of lock entries in lock table
- **More to the story**
 - Optimistic/Multi-version/Timestamp CC
 - Index “latching”, phantoms
 - Actually, there’s much much more :-)
