## **Convex Sets**

Yuanming Shi

ShanghaiTech University

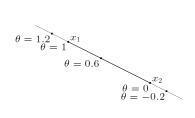

### **Outline**

- 1 Affine and Convex Sets
- 2 Some Important Examples
- 3 Operations that Preserve Convexity
- 4 Generalized Inequalities
- **5** Separating and Supporting Hyperplanes

#### **Definition of Affine Set**

Line: through  $x_1, x_2$ : all points

$$\boldsymbol{x} = \theta \boldsymbol{x}_1 + (1 - \theta) \boldsymbol{x}_2 \quad (\theta \in \mathbb{R})$$

- Affine set: contains the line through any two distinct points in the set
- **Example:** solution set of linear equations  $\{x|Ax = b\}$  (conversely, every affine set can be expressed as solution set of system of linear equations)

#### **Definition of Convex Set**

Line segment: between  $x_1$  and  $x_2$ : all points

$$\boldsymbol{x} = \theta \boldsymbol{x}_1 + (1 - \theta) \boldsymbol{x}_2$$

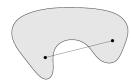

with  $0 < \theta < 1$ 

**Convex set:** contains line segment between any two points in the set

$$x_1, x_2 \in C, 0 \le \theta \le 1 \implies \theta x_1 + (1 - \theta)x_2 \in C$$

**Examples** (one convex, two nonconvex sets)

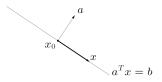

### **Outline**

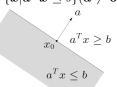

- 1 Affine and Convex Sets
- 2 Some Important Examples
- 3 Operations that Preserve Convexity
- 4 Generalized Inequalities
- **5** Separating and Supporting Hyperplanes

# **Examples: Hyperplanes and Halfspaces**

Hyperplane: set of the form  $\{x|a^Tx=b\}(a\neq 0)$ 

Halfspace: set of the form  $\{x|a^Tx \leq b\}(a \neq 0)$ 

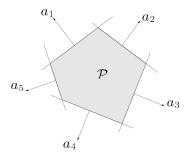

- $\boldsymbol{a}$  is the normal vector
- hyperplanes are affine and convex; halfspaces are convex

## **Example: Polyhedra**

Solution set of finitely many linear inequalities and equalities

$$Ax \leq b$$
,  $Cx = d$ 

 $(A \in \mathbb{R}^{m \times n}, C \in \mathbb{R}^{p \times n}, \preceq \text{ is componentwise inequality})$ 

polyhedron is intersection of finite number of halfspaces and hyperplanes

## **Examples: Euclidean Balls and Ellipsoids**

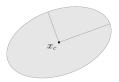

**(Euclidean) Ball** with center  $x_c$  and radius r:

$$B(x_c, r) = \{x | \|x - x_c\|_2 \le r\} = \{x_c + ru | \|u\|_2 \le 1\}$$

**Ellipsoid:** set of the form

$$E(\boldsymbol{x}_c, \boldsymbol{P}) = \{\boldsymbol{x} | (\boldsymbol{x} - \boldsymbol{x}_c)^T \boldsymbol{P}^{-1} (\boldsymbol{x} - \boldsymbol{x}_c) \le 1\}$$
$$= \{\boldsymbol{x}_c + \boldsymbol{A} \boldsymbol{u} | || \boldsymbol{u} ||_2 \le 1\}$$

with  $P \in \mathbb{S}^n_{++}$  (i.e., P symmetric positive definite), A square and nonsingular

### **Convex Combination and Convex Hull**

**Convex combination** of  $x_1, \dots, x_k$ : any point x of the form

$$\boldsymbol{x} = \theta_1 \boldsymbol{x}_1 + \theta_2 \boldsymbol{x}_2 + \dots + \theta_k \boldsymbol{x}_k$$

with  $\theta_1 + \cdots + \theta_k = 1, \theta_i > 0$ 

**Convex hull conv** S: set of all convex combinations of points in S

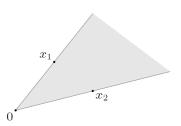

#### **Conic Combination and Convex Cone**

ightharpoonup Conic (nonnegative) combination of  $x_1$  and  $x_2$ : any point of the form

$$\boldsymbol{x} = \theta_1 \boldsymbol{x}_1 + \theta_2 \boldsymbol{x}_2$$

with  $\theta_1 \geq 0, \theta_2 \geq 0$ 

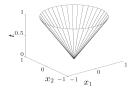

Convex cone: set that contains all conic combinations of points in the set

### **Convex Cones: Norm Balls and Norm Cones**

- Norm: a function  $\|\cdot\|$  that satisfies
  - $\|\boldsymbol{x}\| \ge 0$ ;  $\|\boldsymbol{x}\| = 0$  if and only if  $\boldsymbol{x} = \boldsymbol{0}$
  - $\|t\boldsymbol{x}\| = |t|\|\boldsymbol{x}\| \text{ for } t \in \mathbb{R}$
  - $\|x + y\| \le \|x\| + \|y\|$

notation:  $\|\cdot\|$  general (unspecified) norm;  $\|\cdot\|_{symb}$  a particular norm

- Norm ball with center  $x_c$  and radius r:  $\{x|||x-x_c|| \le r\}$
- Norm cone:  $\{(\boldsymbol{x},t)\in\mathbb{R}^{n+1}|\|\boldsymbol{x}\|\leq t\}$

Euclidean norm cone or second-order cone (aka ice-cream cone)

### **Positive Semidefinite Cone**

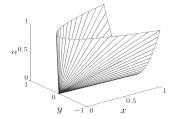

#### Notation

- $\mathbb{S}^n$  is set of symmetric  $n \times n$  matrices
- $\mathbb{S}^n_+ = \{ \mathbf{X} \in \mathbb{S}^n | \mathbf{X} \succeq 0 \}$ : positive semidefinite  $n \times n$  matrices

$$m{X} \in \mathbb{S}^n_+ \quad \Longleftrightarrow \quad m{z}^{ op} m{X} m{z} \geq 0 \text{ for all } m{z}$$

 $\mathbb{S}^n_+$  is a convex cone

**Example:**  $\begin{bmatrix} x & y \\ y & z \end{bmatrix} \in \mathbb{S}^2_+$ 

### **Outline**

- 1 Affine and Convex Sets
- 2 Some Important Examples
- 3 Operations that Preserve Convexity
- 4 Generalized Inequalities
- 5 Separating and Supporting Hyperplanes

## **Operations that Preserve Convexity**

How to establish the convexity of a given set *C* 

Apply the definition (can be cumbersome)

$$x_1, x_2 \in C, 0 \le \theta \le 1 \implies \theta x_1 + (1 - \theta)x_2 \in C$$

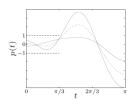

- Show that C is obtained from simple convex sets(hyperplanes, halfspaces, norm balls,  $\cdots$ ) by operations that preserve convexity
  - intersection
  - affine functions
  - perspective function
  - linear-fractional functions

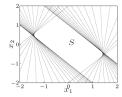

#### Intersection

- **Intersection:** if  $S_1, S_2, \ldots, S_k$  are convex, then  $S_1 \cap S_2 \cap \cdots \cap S_k$  is convex (k can be any positive integer)
- Example 1: a polyhedron is the intersection of halfspaces and hyperplanes
- Example 2:

$$S = \{ \boldsymbol{x} \in \mathbb{R}^m | |p(t)| \le 1 \text{ for } |t| \le \pi/3 \}$$

where  $p(t) = x_1 \cos t + x_2 \cos 2t + \dots + x_m \cos mt$ 

for m=2

#### **Affine Function**

suppose  $f: \mathbb{R}^n \longrightarrow \mathbb{R}^m$  is affine  $(f(x) = Ax + b \text{ with } A \in \mathbb{R}^{m \times n}, b \in \mathbb{R}^m)$ 

ullet the image of a convex set under f is convex

$$S \subseteq \mathbb{R}^n \text{ convex} \implies f(S) = \{f(\boldsymbol{x}) | \boldsymbol{x} \in S\} \text{ convex}$$

the inverse image  $f^{-1}(C)$  a convex set under f is convex  $C \subseteq \mathbb{R}^m$  convex  $\implies f^{-1}(C) = \{x \in \mathbb{R}^n | f(x) \in C\}$  convex

### Examples

- scaling, translation, projection
- solution set of linear matrix inequality  $\{x|x_1A_1 + \cdots + x_mA_m \leq B\}$  (with  $A_i, B \in \mathbb{S}^p$ )
- $\{(\boldsymbol{x},t)\in\mathbb{R}^{n+1}|\|\boldsymbol{x}\|\leq t\}$  is convex, so is

$$\{ \boldsymbol{x} \in \mathbb{R}^n | \| \boldsymbol{A} \boldsymbol{x} + \boldsymbol{b} \| \le \boldsymbol{c}^T \boldsymbol{x} + d \}$$

# Perspective and Linear-fractional Function I

**Perspective function**  $P: \mathbb{R}^{n+1} \to \mathbb{R}^n$ 

$$P(x,t) = x/t$$
,  $dom P = \{(x,t)|t > 0\}$ 

images and inverse images of convex sets under perspective are convex

**Linear-fractional function**  $f: \mathbb{R}^n \to \mathbb{R}^m$ 

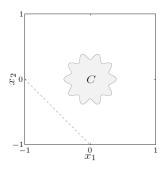

$$f(x) = \frac{Ax + b}{c^T x + d}, \quad \text{dom} f = \{x | c^T x + d > 0\}$$

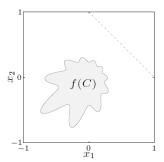

images and inverse images of convex sets under linear-fractional functions are convex

## Perspective and Linear-fractional Function II

### **Examples** of a linear-fractional function

$$f(\boldsymbol{x}) = \frac{1}{x_1 + x_2 + 1} \boldsymbol{x}$$

### **Outline**

- 1 Affine and Convex Sets
- 2 Some Important Examples
- 3 Operations that Preserve Convexity
- 4 Generalized Inequalities
- 5 Separating and Supporting Hyperplanes

## **Generalized Inequalities I**

- A convex cone  $K \subseteq \mathbb{R}^n$  is a **proper cone** if
  - K is closed (contains its boundary)
  - \* *K* is solid (has nonempty interior)
  - \* *K* is pointed (contains no line)

#### Examples

nonnegative orthant

$$K = \mathbb{R}^{n}_{+} = \{ \boldsymbol{x} \in \mathbb{R}^{n} | x_{i} \geq 0, i = 1, \dots, n \}$$

positive semidefinite cone

$$K = \mathbb{S}_+^n = \{ \boldsymbol{X} \in \mathbb{R}^{n \times n} | \boldsymbol{X} = \boldsymbol{X}^T \succeq \mathbf{0} \}$$

 $\bullet$  nonnegative polynomials on [0,1]:

$$K = \{ \boldsymbol{x} \in \mathbb{R}^n | x_1 + x_2 t + x_3 t^2 + \dots + x_n t^{n-1} \ge 0 \text{ for } t \in [0, 1] \}$$

## **Generalized Inequalities II**

**Generalized inequality** defined by a proper cone *K*:

$$y \succeq_K x \iff y - x \succeq_K 0 \text{ or } y - x \in K$$

#### **Examples**

**Componentwise inequality**  $(K = \mathbb{R}^n_+)$ 

$$\boldsymbol{y} \succeq_{\mathbb{R}^n_+} \boldsymbol{x} \iff y_i \geq x_i, \quad i = 1, \cdots, n$$

 $\bullet$  Matrix inequality  $(K = \mathbb{S}^n_+)$ 

$$Y \succeq_{\mathbb{S}^n_+} X \iff Y - X$$
 positive semidefinite

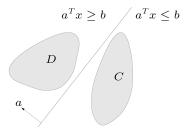

### **Outline**

- 1 Affine and Convex Sets
- 2 Some Important Examples
- 3 Operations that Preserve Convexity
- 4 Generalized Inequalities
- **5** Separating and Supporting Hyperplanes

## **Separating Hyperplane Theorem**

If *C* and *D* are nonempty disjoint convex sets, there exist  $a \neq 0$  and b, such that

$$a^T x \le b \text{ for } x \in C, \quad a^T x \ge b \text{ for } x \in D$$

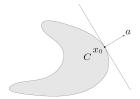

the hyperplane  $\{x|a^Tx=b\}$  separates C and D

## **Supporting Hyperplane Theorem**

**Supporting hyperplane** to set C at boundary point  $x_0$ :

$$\{\boldsymbol{x}|\boldsymbol{a}^T\boldsymbol{x}=\boldsymbol{a}^T\boldsymbol{x}_0\}$$

where  $a \neq 0$  and  $a^T x \leq a^T x_0$  for all  $x \in C$ 

**Supporting hyperplane theorem:** if C is convex, then there exists a supporting hyperplane at every boundary point of C

### **Dual Cones and Generalized Inequalities**

**Dual cone** of a cone K:

$$K^* = \{ \boldsymbol{y} | \boldsymbol{y}^T \boldsymbol{x} \ge 0 \text{ for all } \boldsymbol{x} \in K \}$$

Examples

```
 \begin{array}{l} \mathbf{i} \quad K = \mathbb{R}_+^n \colon K^* = \mathbb{R}_+^n \\ \mathbf{i} \quad K = \mathbb{S}_+^n \colon K^* = \mathbb{S}_+^n \\ \mathbf{i} \quad K = \{(\boldsymbol{x},t) | || \boldsymbol{x} ||_2 \leq t\} \colon K^* = \{(\boldsymbol{x},t) | || \boldsymbol{x} ||_2 \leq t\} \\ \mathbf{i} \quad K = \{(\boldsymbol{x},t) | || \boldsymbol{x} ||_1 \leq t\} \colon K^* = \{(\boldsymbol{x},t) | || \boldsymbol{x} ||_\infty \leq t\} \\ \end{array}
```

First three examples are self-dual cones

Dual cones of proper cones are proper, hence define generalized inequalities:

$$y \succeq_{K^*} \mathbf{0} \iff y^T x \ge 0 \text{ for all } x \succeq_K \mathbf{0}$$
