### Motivation

If you can not calculate a probability or expectation exactly, then you have three powerful strategies:

- Bounds (upper and lower bounds) on probability using inequalities.
- Approximations using limiting theorems
  - ▶ Poisson approximation: The Law of Small Numbers
  - Sample mean limit: The Law of Large Numbers
  - ▶ Normal approximation: The Central Limit Theorem
- Simulations using Monte Carlo

# Cauchy-Schwarz Inequality

### Theorem

For any r.v.s X and Y with finite variances,

$$|E(XY)| \leq \sqrt{E(X^2)E(Y^2)}.$$

### **Revisit Correlation**

# Jensen's Inequality

If f is a convex function,  $0 \le \lambda_1, \lambda_2 \le 1, \lambda_1 + \lambda_2 = 1$ , then for any  $x_1, x_2$ ,

$$f(\lambda_1 x_1 + \lambda_2 x_2) \leq \lambda_1 f(x_1) + \lambda_2 f(x_2).$$

Ziyu Shao (ShanghaiTech)

Lecture 1: Inequalitie

March 1 & 3, 2021

7 / 47

# Jensen's Inequality

### Theorem

Let X be a random variable. If g is a convex function, then

 $E(g(X)) \ge g(E(X))$ . If g is a concave function, then

 $E(g(X)) \le g(E(X))$ . In both cases, the only way that equality can hold is if there are constants a and b such that g(X) = a + bX with probability 1.

### **Quick Examples**

Ziyu Shao (ShanghaiTech)

Lecture 1: Inequalities

# Entropy

- Let X be a discrete r.v. whose distinct possible values are  $a_1, a_2, ..., a_n$ , with probabilities  $p_1, p_2, ..., p_n$  respectively (so  $p_1 + p_2 + \cdots + p_n = 1$ ).
- The *entropy* of X is defined as follows:  $H(X) = \sum_{j=1}^{n} p_j \log_2 (1/p_j)$ .
- Using Jensen's inequality, show that the maximum possible entropy for X is when its distribution is uniform over  $a_1, a_2, \ldots, a_n$ , i.e.,  $p_i = 1/n$  for all j.
- This makes sense intuitively, since learning the value of X conveys the most information on average when X is equally likely to take any of its values, and the least possible information if X is a constant.

# Kullback-Leibler Divergence

Let  $p = (p_1, ..., p_n)$  and  $r = (r_1, ..., r_n)$  be two probability vectors (so each is nonnegative and sums to 1). Think of each as a possible PMF for a random variable whose support consists of n distinct values. The Kullback-Leibler divergence between p and r is defined as

$$D(p,r) = \sum_{j=1}^{n} p_{j} \log_{2}(1/r_{j}) - \sum_{j=1}^{n} p_{j} \log_{2}(1/p_{j}).$$

Show that the Kullback-Leibler divergence is nonnegative.

# Norm Inequality

For a random variable X whose moment of order r > 0 is finite, we define the following norm

$$||X_{|}|_r = (\mathbb{E}(|X|^r))^{\frac{1}{r}}.$$

- The Holder Inequality. Let  $\frac{1}{p} + \frac{1}{q} = 1$ . If  $\mathbb{E}(|X|^p), \mathbb{E}(|X|^q) < \infty$ , then  $|\mathbb{E}(XY)| \leq \mathbb{E}|XY| \leq ||X||_p \cdot ||X||_q$ .
- The Lyapunov Inequality. For  $0 < r \le p$ ,  $||X||_r \le ||X||_p$ .
- The Minkowski Inequality. Let  $p \ge 1$ ,  $\mathbb{E}(|X|^p)$ ,  $\mathbb{E}(|Y|^p) < \infty$ , then  $||X + Y||_p \le ||X||_p + ||Y||_p$ .

# Markov's Inequality

### Theorem

For any r.v. X and constant a > 0,

$$P(|X| \geq a) \leq \frac{E|X|}{a}.$$

March 1 & 3, 2021

17 / 47

# Chernoff's Inequality

### Theorem

For any r.v. X and constants a > 0 and t > 0,

$$P(X \ge a) \le \frac{E(e^{tX})}{e^{ta}}.$$

Ziyu Shao (ShanghaiTech)

Lecture 1: Inequalitie

March 1 & 3, 2021

19 / 47

# Chernoff's Technique

### Theorem

For any r.v. X and constants a,

$$P(X \ge a) \le \inf_{t>0} \frac{E(e^{tX})}{e^{ta}}$$

$$P(X \le a) \le \inf_{t < 0} \frac{E(e^{tX})}{e^{ta}}.$$

# Hoeffding Lemma

### Lemma

Let the random variable X satisfy  $\mathbb{E}(X)=0$  and  $a\leq X\leq b$ , where a and b are constants. Then for any  $\lambda>0$ ,

$$\mathbb{E}(e^{\lambda X}) \leq e^{\frac{1}{8}\lambda^2(b-a)^2}.$$

### Useful Analysis Tools

• Jensen's inequality: if f is convex,  $0 \le \lambda_1, \lambda_2 \le 1, \lambda_1 + \lambda_2 = 1$ , then for any  $x_1, x_2$ ,

$$f(\lambda_1 x_1 + \lambda_2 x_2) \leq \lambda_1 f(x_1) + \lambda_2 f(x_2).$$

• Taylor's theorem or Taylor's expansion: If all the derivatives of a function f(x) exist at point a, then for any positive integer k, there exist a real number  $\theta$  between a and x such that

$$f(x) = f(a) + \cdots + \frac{f^{(k)}(a)}{k!}(x-a)^k + \frac{f^{(k+1)}(\theta)}{(k+1)!}(x-a)^{k+1}.$$

# Hoeffding Bound

### Theorem

Let the random variables  $X_1, X_2, \ldots, X_n$  be independent with  $E(X_i) = \mu$ ,  $a \le X_i \le b$  for each  $i = 1, \ldots, n$ , where a, b are constants. Then for any  $\epsilon \ge 0$ ,

$$\mathbb{P}(|\frac{1}{n}\sum_{i=1}^{n}X_{i}-\mu|\geq\epsilon)\leq 2e^{-\frac{2n\epsilon^{2}}{(b-a)^{2}}}.$$

# Proof Ziyu Shao (ShanghaiTech) Lecture 1: Inequalities March 1 & 3, 2021 36/47

### More General Hoeffding Bound

### **Theorem**

Let the random variables  $X_1, X_2, \ldots, X_n$  be independent, with  $a_k \leq X_k \leq b_k$  for each k, where  $a_k, b_k$  are constants. Let  $S_n = \sum_{k=1}^n X_k$  and let  $\mu = \mathbb{E}(S_n)$ . Then for any  $t \geq 0$ ,

$$\mathbb{P}(|S_n - \mu| \ge t) \le 2e^{-\frac{2t^2}{\sum_{k=1}^n (b_k - a_k)^2}}.$$

# Application: Parameter Estimation

Instead of predicting a single value for the parameter, we given an interval that is likely to contain the parameter:

### **Definition**

A  $1-\delta$  confidence interval for a parameter p is an interval  $[\hat{p}-\epsilon,\hat{p}+\epsilon]$  such that

$$Pr(p \in [\hat{p} - \epsilon, \hat{p} + \epsilon]) \ge 1 - \delta.$$

# Application: Parameter Estimation

Tossing a coin with probability p landing heads and probability 1-p landing tails. p is unknown and we need to estimate its value from experiments results. We toss such coin N times, Let  $X_i = 1$  if the ith result is head, otherwise 0. We estimate p by using  $\hat{p} = \frac{X_1 + \ldots + X_N}{N}$ . Find the confidence interval for p.
